

ULTRA ACCESS Scaffolding Safety Alert

The modern way to get your Roof "Tin" Sheets up where you need them

Once upon a time, scaffolders were left to their own devices on how to get their "Tin" Sheets up to where they needed them, with a whole manner of self-created contraptions made to get these unwieldily and potentially dangerous materials up to the very top of a Temporary Roof, or by physically having to *chain them up... **chaining is the task of hand-by-hand passing scaffolding materials up/down, usually on the outside on the structure - both tiring and physically demanding .**

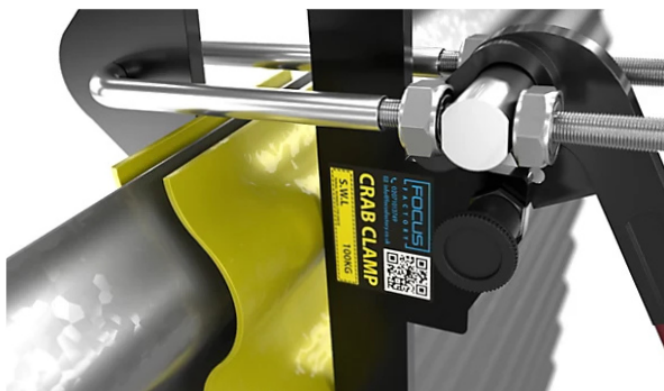

Thankfully, innovations within the industry have helped creat several pre-fabricated and task-specific clamps, with the latest on the market being the **Crab Clamp**, specially designed to hold several sheets at a time, and can be operated without the need for the Labourer (or whoever is on the ground) without them needing a scaffold spanner.

The 'Crab Clamp' Lifting Device

For roughly £300 (inc.VAT), and with the base unit (without sheets added) being easily transportable, from site to site.

It would pay for itself in the matter of days, with the additional labour costs required to get these sheets up the "old fashioned way" - by sheer brute force, being more than the cost of this handy bit of kit.

And if not chaining these sheets up, but instead using some self-made contraption and something was to happen because of it, like an accident or incident... will that invalidate your scaffolding companies insurances? Maybe...

Why take the risk?

If your company does a lot of Temporary Roofs, **why not consider this piece of kit as a worthwhile investment?** It pays for itself, almost straight away and could help not only reduce manual handling injuries, but also reduces the need for additional labour, which is a plus on its own.

Available on the internet to buy, and also on **Leachs** website.

Very much a worthwhile investment for any scaffolding contractor serious about safety and time/money saving.
